TITLE: Synthesis of 1-chloroborocycloalkanes

SOURCE: AN SSSR. Izvestiya. Ser. khim., no. 1, 1964, 50-54

TOPIC TAGS: 1-chloroborocycloalkane, synthesis, tetraalkyldiborane catalyst, bis-alpha. omega-(1-borcycloalkyl)alkane, borokane cyclization, 1.5-dichloro-1.5-diborocyclooctane, bis-alpha, omega-(dichlorobor)alkane

ABSTRACT: 1-chloroborocyclopentane, 1-chloroborocyclohexane and 1-chloroborocycloheptane may be synthesized by reacting the appropriate bis-alpha, omega-(1-borcyclo-alkyl)alkane with a 1:1 molar ratio of BCl_3 at 140C in the presence of a catalytic amount of tetraalkyldiborane to form a polymer which depolymerizes on heating in vacuum. On heating $Cl_2B(CH_2)_nBCl_2$, where $n=4, 5, \text{ or } 6$, to 200-250C, BCl_3 is liberated and the alkane is cyclized to form the corresponding 1-chloroborocycloalkane. Similar treatment of $Cl_2B(CH_2)_3BCl_2$ results in BCl_3

Card 1/2

ACCESSION NR: AP4010038

evolution and the formation of 1, 5-dichloro-1, 5-diborocyclooctane. Bis-alpha, omega-(1-borocycloalkyl)alkanes, when heated with 1:4 molar ratio of BCl_3 to 140C in the presence of a catalytic amount of tetraalkyldiborane, are converted to the corresponding bis-alpha, omega-(dichlorobor)alkanes. TITLE: Metallizing of B sub 10 C sub 2 H sub 12 (baren) and its derivatives with sodamide

SOURCE: AN SSSR. Izv. Seriya khimicheskaya, no. 3, 1964, 582

TOPIC TAGS: metallizing, butyllithium, sodamide, baren, baren aryl derivatives, baren alkyl derivatives, baren ring, baren ring stability, sodium amide, metal spraying

ABSTRACT: Like butyllithium, sodamide will easily metallize baren as well as its aryl and alkyl derivatives at the nucleus of the carbon atom;

Card 1/2

ACCESSION NR: AP4025016

a quantitative yield of the sodium derivative will be obtained upon using an excess of sodamide. Further carbonylation will yield the corresponding acids.

Sodamide treatment will result in the formation of monobarenylsodium only, which is in contrast to treatment with butyllithium. Such metallization indicates the ease with which the proton is detached from the carbon atom of the baren ring, due apparently to the great stability of the barenyl anion. Orig. acc. has: 4 formulas.

TITLE: Reaction of boron trifluoride with sodium aluminum hydride.

SOURCE: Zhurnal neorganicheskoy khimii, v. 9, no. 6, 1964, 1350-1357

TOPIC TAGS: boron trifluoride, sodium aluminum hydride, diborane, diborane synthesis

ABSTRACT: The purpose of this work was to investigate the interaction of boron trifluoride with sodium aluminum hydride as a possible method for the production of diborane. The work was conducted in dimethyl ether solutions of diethylene glycol at different temperatures and with the addition of constituents in different orders. It was established that upon the interaction of equimolar amounts of sodium aluminum hydride and boron trifluoride in diethylene glycol solutions with the normal order of addition of reagents, sodium borohydride is produced with a high yield. In this reaction there was a 90% yield of diborane. It is shown that this reaction proceeds according to two different paths depending on the temperature. At 25°C the reaction is: $3\text{NaAlH}_4 + 7\text{BF}_3 \longrightarrow 2\text{B}_2\text{H}_6 + 3\text{NaBF}_4 + 2\text{AlF}_3$ and at 80 - 100°C the reaction is: $3\text{NaAlH}_4 + 4\text{BF}_3 \longrightarrow 2\text{B}_2\text{H}_6 + 3\text{NaAlF}_4$

S/0020/64/155/005/1119/1122

AUTHOR: Zakharkin, L. I.; Stanko, V. I.; Brattsev, V. A.; Chapovskiy, Yu. A;
Klimova, A. I.; Okhlobystin, O. Yu.; Ponamarenko, A. A. (Deceased)TITLE: Synthesis and investigation of properties of a new class of organoboron
compounds: B sub 10 C sub 2 H sub 12 (barene) and its derivatives.

SOURCE: AN SSSR. Doklady*, v. 155, no. 5, 1964, 1119-1122

TOPIC TAGS: barene, synthesis, organoboron compound, decaborane acetylenic compound
reaction, B sub 10 C sub 2 H sub 12, barene derivative, sigma bond formation, hy-
drolysis stability, thermal stability, acid solvent stability, barene hydrocarbon,
barene acetate, dihydroxymethylbarene, haloalkylbarene, dihalodialkylbarene, barene
ester, barene ketone, barene ether, halogenation, methanolation, oxidation, Grig-
nard reaction, cyclizationABSTRACT: The reaction of decaborane with different acetylenic compounds was
studied in detail. It was found that in the presence of materials which form
complexes of the type $B_{10}H_{12}L_2$ (L " ligand) with decaborane, a new class of com-
pounds is formed: $B_{10}C_2H_{10}^{RR'}$, barenes.

Card 1/3

ACCESSION NR: AP4034541

The reaction is two stage:

1. $B_{10}H_{16} + 2L \rightarrow B_{10}H_{14}L_2 + H_2$
2. $B_{10}H_{14}L_2 + RC \equiv CR_1 \rightarrow B_{10}C_2H_{10}RR_1 + 2L + H_2$

where $L = CH_3CN, (C_2H_5)_2S, (C_2H_5)_3As, CHON(CH_3)_3$.

The hydrogen is given off between the B_5 and B_{10} and the B_7 and B_8 in the complex, so the 12 atom system has no hydrogen bridges. X-ray, IR and chemical analyses show that two σ -bonds are formed on reaction with acetylenic compounds. The barenes are stable to hydrolysis, high temperatures and mineral acids. A number of barene compounds were synthesized and characterized: barene hydrocarbons, acetates of alcohols of the barene series, dihydroxymethylbarene, haloalkyl- and dihalodialkylbarenes, complex esters of barene acids and diacids, ketones and simple ethers. Some of the reactions involved are discussed: the reaction of alkyl or arylbarenes with butyllithium with subsequent carbonation to form barene acids; substitution of the boron or carbon hydrogens with halogens; methanolation

Card 2/3

ACCESSION NR: AP4034541

of the acetates to form alcohols; oxidation of the alcohols to acids with $\text{CrO}_3/\text{H}_2\text{SO}_4$; oxidation of hydroxymethylbarenne with KMnO_4 to form barene; Grignard hydride of phenylpropiolic acid to form a barene derivative. Orig. art. has: 1 reaction; cyclization during reaction of a complex decaborane with the chloran-
table and 12 equations.

5. TITLE: Nitration of phenylborane, phenylborane carbonic acid, and phenylneoborane

6. SOURCE: AN SSSR. Doklady, v. 164, no. 3, 1965, 577-580

7. TOPIC TAGS: boranorganic compound, nitration phenylborane, phenylneoborane

ABSTRACT: The nitration of phenylborane, phenylborane carbonic acid, and phenylneoborane is investigated. The reaction of phenylborane with concentrated nitric acid in the presence of concentrated sulfuric acid is carried out in CH_2Cl_2 at room temperature with a 1:1 mixture of HNO_3 and H_2SO_4 .

The investigation is an extension of previous studies on this system, by L. I. Zulcharkin, V. V. Ivanov, and V. V. Kostylev, *Izv. Akad. Nauk SSSR, Ser. Khim.*, 1963, 220. Melting points and reaction yields for the synthesized compounds are presented. It is concluded that the borane and neoborane groups possess electron-acceptor properties. The phenylborane carbonic acid is a strong electron-acceptor compound.

TITLE: Synthesis of carboran- and neocarboran-aminesSOURCE: Zhurnal obshchey khimii, v. 35, no. 10, 1965, 1882-1884

TOPIC TAGS: carborane, neocarborane, amine

ABSTRACT: Carboran- and neocarboran-amines with the NH_2 -group at one of the C atoms of the carborane- or neocarborane ring have been synthesized for the first time. The synthesis proceeds in two steps: treatment of the respective anilides with sodium azide and heating of the azides formed with concentrated sulfuric acid. Carboran- and neocarboran-amines are soluble in concentrated H_2SO_4 . Carboranamines are weak bases due to the electron acceptor effect of the carborane ring and to steric factors. ABSTRACT: The possibility of rupturing the C-C bond in neobarene compounds was investigated. Electron acceptor properties in the neobarene system were found to be weaker than in the barene system. For instance, potassium phenylboronate and cyanide was not carboxylated between the carbonyl carbon and the barene ring in neobarene. However, the C-C bond was readily split on treatment with lithium ethylate in ethanol. The intermediate formed is a neocarenyl anion. Carbonyl anions were readily coupled with lithium aluminum hydride to the carbonyl. An boron atom of the carbon atom of the anion exhibits positive properties; it is readily exchanged

ABSTRACT: When a solution of barene in carbon tetrachloride or chloroform was boiled in the presence of aluminum trichloride, the hydrogen atoms of the barene were readily substituted by chlorine atoms to form mono-, di- and trichlorobarenes. Similar exchange of hydrogen for chlorine occurred in vinylbarene and methylbarene. Probable mechanism for these exchanges is discussed. (orig. art., Russ. translation)

ABSTRACT: Aryl substituted benzenes readily formed colored paramagnetic solutions by the action of potassium in tetrahydrofuran or dimethoxyethane. These solutions were decolorized by air and by decomposition with water or alcohol, but there was no hydrogen evolution. The relatively high affinity of phenylbenzene for electrons was demonstrated by polarographic reduction and by the use of no attachment. The ESR spectra of the most substituted benzene, 4-is-phenylbenzene, were measured at 60 MHz with potassium, the polarographic method, and the ESR spectrometer.

The authors thank Yu. V. Kostylev for the ESR spectra, V. V. Kostylev for the polarographic measurements, and V. V. Art.

TITLE: Preparation of diborane from sodium aluminum hydride and boron halides in etheral and hydrocarbon acids

SOURCE: Zhurnal neorganicheskoy khimii, v. 11, no. 1, 1966, 13-19

TOPIC TAGS: diborane, borohydride, boron compound, inorganic synthesis

ABSTRACT: Four possible methods for preparing diborane (I) were investigated:
a) reaction of boron trichloride (II) with sodium aluminum hydride (III) according to the equation

b) reacting boron trifluoride (IV) with III in various ethers and hydrocarbons as solvents; c) two-step synthesis, the first step being reaction of III with LiCl or AlCl₃, and the second--the addition of ether solution of IV; d) also a two-step synthesis involving first the preparation of a reaction mixture of AlCl₃ with sodium borohydride (V) and then a reaction of this solution with etheral V. This study is an expansion of the work published earlier by the authors (Zh. neorg. khimii, 7,

UDC: 546.271.0

Card 1/2

I 15305-66

1350, 1964) in which I was obtained by reacting III with IV in diglyme. Reactions were performed under a stream of pure nitrogen which, on leaving the reaction vessel, was passed through acetone traps for collecting the diborane. It was observed that: 1) reaction of (a) proceeds with a number of intermediates; 2) high yields of I are obtained from reaction a if 5--10% of diglyme are added to the ether or heptane solvent; 3) reaction c produces I in large amounts; 4) reaction of III with IV in THF results in high yields of I; 5) addition of Acetone to diglyme solutions of III or V, followed by addition of IV, permits utilisation of total boron content. TITLE: Synthesis of ketones of the barene series

SOURCE: AN SSSR. Izvestiya. Seriya khimicheskaya, no. 1, 1966, 151-153

TOPIC TAGS: chemical synthesis, carboxylic acid chloride, barene series, ketone, organoboron compound

ABSTRACT: Because ketones of the barene series, which contains a carbonyl group linked with the carbon atom of the barene nucleus, are virtually unstudied, the synthesis of only two such ketones having been reported, the authors investigated their synthesis. It is found that ketones of the barene series can be readily synthesized under the effect of lithium derivatives of barenes on the acid chlorides of carboxylic acids. The acid chlorides of aromatic, aliphatic, and heterocyclic acids are introduced into the reaction. The yields of ketones are 50-95% of the theoretical. The 15 ketones synthesized by this method are presented in Table 1. Symmetric and asymmetric bis-barene ketones are synthesized when the acid chlorides of barene carboxylic acids are used. Orig. art. has: 1 table.

TITLE: Influence of coordination on the ability of organocadmium compounds for metallation reaction

SOURCE: Zhurnal obshchey khimii, v. 36, no. 10, 1966, 1734-1735

TOPIC TAGS: organocadmium compound, metallation, coordination chemistry, organolithium compound, organomagnesium compound

SUB CODE: 07

ABSTRACT: The metallation of phenylacetylene with diethylcadmium in the presence of various electron donor aprotic complex formers was studied to determine whether the general principle of increasing nucleophilic activity of the metal-carbon bond in coordination is applicable to such relatively nonreactive substances as alkyl derivatives of cadmium. It was found that the nucleophilic activity of diethylcadmium can be varied in very wide range in the selected model reaction by suitable selection of the complex-forming solvents. The rate of metallation of phenylacetylene by diethylcadmium depends on the complex-forming ability of the medium: in diethyl ether the reaction virtually does not take place, while in the presence of an equimolar amount of N,N'-tetramethylethyl-

ACC NR: AP7012426

endiamine, which forms a complex with diethylcadmium, metallation is extremely vigorous. Other complex formers tested occupy intermediate positions (arranged according to increasing acceleration of the reaction): dimethoxyethane, dimethylformamide, dimethylsulfoxide, hexamethyltriamidophosphate, and alpha, alpha-dipyridyl. In the presence of sufficiently strong complexformers, the metallating ability of diethylcadmium was found to be close to the metallating ability of the corresponding organomagnesium and organolithium compounds.

TITLE: Effect of alkali metals on lithium aluminum hydride

SOURCE: Zhurnal neorganicheskoy khimii, v. 11, no. 5, 1966, 977-980

TOPIC TAGS: lithium aluminum hydride, alkali metal

ABSTRACT: The reactions of lithium aluminum hydride with alkali metals were studied in ether solvents (diethyl ether, ditutyl ether, diethylene glycol diethyl ether and tetrahydrofuran). The reactions of LiAlH₄ with sodium and potassium were also studied. With sodium, potassium, rubidium and cesium, metallic lithium separates and the corresponding alkali aluminum hydride is formed:

This is an equilibrium reaction. A side reaction is the hydrogenation of the alkali metal of the aluminum hydride, as follows:

Card 1/2

UDC: 546.623'34'11+546.311

L 45719-66

ACC NR: AP6025697

Another side reaction is thought to be hydrogenation by aluminum hydride (formed by the decomposition $MAlH_4 \rightleftharpoons MH + AlH_3$):

The reaction of exchange of the alkali metal with $LiAlH_4$ is faster than the hydrogenation reaction.

TITLE: Some peculiarities of the preparation of rubber mixes in a two-speed
rubber mixer

PERIODICAL: Kauchuk i rezina, no. 10, 1961, 39 - 41

TEXT: Experiments were conducted on the new two-speed rubber mixer APC-140 (DRS-140) manufactured at the Kiyevskiy mashinostroitel'nyy zavod (Kiyev Machine-Building Plant) "Bol'shevik", according to designs of the NIIKhIMash. Its rotors have 19.76/16.76 and 39.52/33.5 rpm, respectively. The capacity of the mixing chamber is 245 liters, the size of the spaces between the blades of the rotors and the walls of the mixing chamber 6-7 mm. Results of the experiments showed that when preparing casing-breaker mixes in the rubber mixer at 40 rpm a mixing duration of 1.5 min without taking into account the loading and unloading, and a specific pressure of 3.7 kg/cm², the volume of the load may be brought to 165 liters without impairing the quality of the mix. The loading coefficient of the chamber of the DRS-140 rubber mixer is 65%. Thus

the effect of the loading volume was checked and the optimum value (165 l) confirmed for the casing and breaker mixes based on 100% NR and combinations of it with CKE (SKB), also for tread mixes based on 100% butadiene-styrene rubbers. The 1.5 min duration time is recommended for the casing-and breaker mixes in one stage at 40 rpm of the rotor with an introduction of sulfur in the 8½-inch rollers. Conditions for preparing tread mixes based on 100% butadiene-styrene rubber mixers available at the plant is pointed out in order to accomplish the second cycle of mixing of the tread mixes as well as introduction of sulfur and accelerators. The following persons took part in the work: J.J. Gavshinov, A.S. Savina, Yu.A. Aleksandrov, A.N. Semenova. There are 4 tables and 10 Soviet-bloc references.

TITLE: On electric property of filiform silver single crystal investigated as a function of temperature

SOURCE: Acta physica polonica, v. 24, no. 1, 1963, 3-12

TOPIC TAGS: electrical resistance, filiform crystal, low temperature physics, cryogenics, filiform silver, monocrystal silver

ABSTRACT: The principle task of this experimental investigation was to determine the electric resistance of filiform silver single crystals at room temperature down to 1.77 - 4.2 K. The diffusion scattering of conduction electrons from the surface as a result of changes in whisker diameter was also under study. The effect of various temperatures on the specific resistance was compared for silver wires and whiskers. The authors describe the method and equipment used in this study and the conditions under which it was carried out, as well as the techniques used to prepare the specimens. The minimum of resistance for silver whiskers was determined.

TITLE: Dependence of the x ray luminescence yields of NaI(Tl) crystals on the intensity of the exciting radiation

SOURCE: Ref. zh. Fizika, Abs. 1D657

REF SOURCE: Visnyk L'viv's'k. un-tu. Ser. fiz. L'viv, 1964, 33-35

TOPIC TAGS: x ray effect, luminescence, activated crystal, luminescent crystal, recombination luminescence, radiative capture, excitation spectrum

ABSTRACT: The author investigated the dependence of x-ray luminescence yields in NaI(Tl) crystals on the x-ray intensity. It is established that the luminescence intensity is higher when excited with the harder harmonics in the presence of the Cu K α line than in the case when only the higher harmonics, separated from the continuous spectrum of the x-ray tube, are present. It is concluded that an appreciable role is played in processes of excitation of luminescence by soft x-radiation by the capture levels due to the prior history of the samples and by the nonradiative recombination centers connected with the surface. responsible for inherent resolution, are inappreciable in this energy range. The light yield per absorbed quantum is thus the only parameter that is important for the present investigation. It is found that the light yield of the γ -ray detector is proportional to the concentration of the activator impurity in the crystal. The best results are obtained with Na²²(I₁) crystals (4 mole per cent thallium iodide) and crystals with maximum γ -ray luminescence (high concentration of the activator impurity -- 1.5 wt. per cent thallium iodide). Good results are obtained when using a natural cleavage face of the crystal prepared by a thin layer of paint. The absorption of the γ -radiation is due to the paint and the crystal. The absorption of the γ -radiation is proportional to the concentration of the activator. We express our thanks to Dr. F. L. Larkay for carrying out some optical measurements and for taking part in the discussion of the results of the paper.¹ Orig. art. has: 2 formulas and 2 figures.
